Professional Summary

My strongest learning happens when an idea becomes a working system. I have explored this through Java applications, AI prediction, wireless packet analysis, and ESP32-based security projects, moving beyond writing code to understanding how a complete system behaves. I want to continue working at the intersection of development and security, where I can experiment with unfamiliar technologies, investigate how systems work, solve technical challenges, and turn concepts into functioning products.

Technical Skills

Languages	Java
Web	HTML, CSS
Database	MySQL, MongoDB
Tools	Git, GitHub, VS Code, Arduino IDE, Wireshark
Core	DBMS, Data Structures, Computer Networks
OS	Windows, Kali Linux

Education

Kongunadu College of Engineering and Technology	2024–2027
B.Tech Information Technology	CGPA: 7.08
Kongunadu Polytechnic College	2022–2024
Diploma in Mechanical Engineering	92%

Experience

Full Stack Developer Trainee – E-soft IT Solutions	Jun 2025
- Developed responsive web applications using HTML, CSS, Java and MySQL. - Implemented CRUD operations, testing and debugging. - Collaborated with developers to deliver reliable software.	

Projects

Detecting Deauthentication Attacks in Open Wi-Fi Networks Using an ESP32-Based Security Monitoring System

ESP32, Arduino IDE, C++, Wi-Fi Packet Sniffing, OLED Display

- Built an ESP32-based wireless security monitoring system for detecting Wi-Fi deauthentication attacks.
- Implemented real-time packet sniffing and IEEE 802.11 management frame analysis.
- Generated OLED alerts and attack notifications for improving wireless security awareness.

Wi-Fi De-authentication Device (Educational Purpose)

ESP8266, Arduino IDE, C++, OLED Display

- Developed a wireless monitoring device capable of analyzing Beacon, Probe, and Deauthentication frames.
- Implemented packet sniffing to identify suspicious wireless activities.
- Displayed network statistics and security alerts on an OLED screen.

Forest Fire AI Prediction System

React, Node.js, Python, REST APIs

- Developed an AI-based forest fire prediction system using environmental and historical datasets.
- Implemented live heatmap visualization for monitoring fire risk.
- Integrated Google Maps, Email, and WhatsApp alerts for emergency response.

Achievements & Certifications

- 1st Place** – Artivers 3.0 Hackathon – Forest Fire AI Prediction System
- 2nd Place** – Tezario 3.0 Project Expo – Detecting Deauthentication Attacks in Open Wi-Fi Networks Using an ESP32-Based Security Monitoring System
- NPTEL – Internet of Things
- Infosys Springboard – Front End Developer
- Fundamentals of Cyber Security
